

It is because of the lack of oxygen.
Even though we can't see the oxygen,
they need it in the water to live.

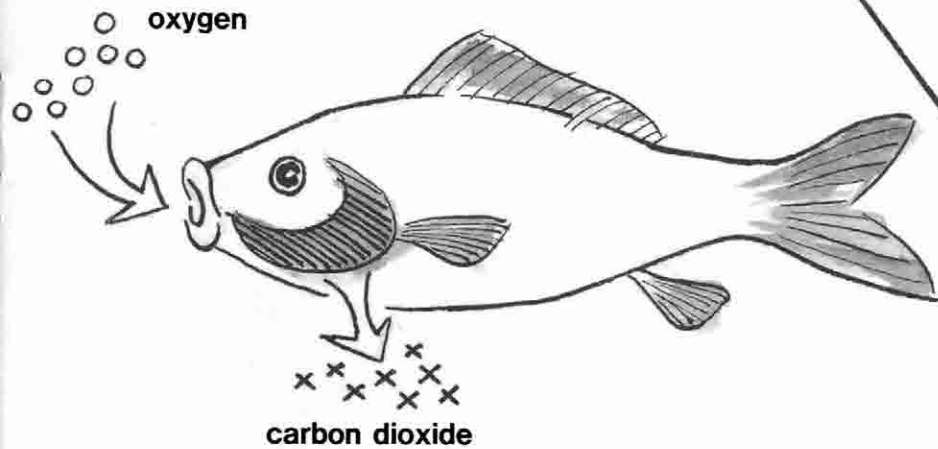

When human beings breathe, we absorb oxygen and breathe out carbon dioxide.

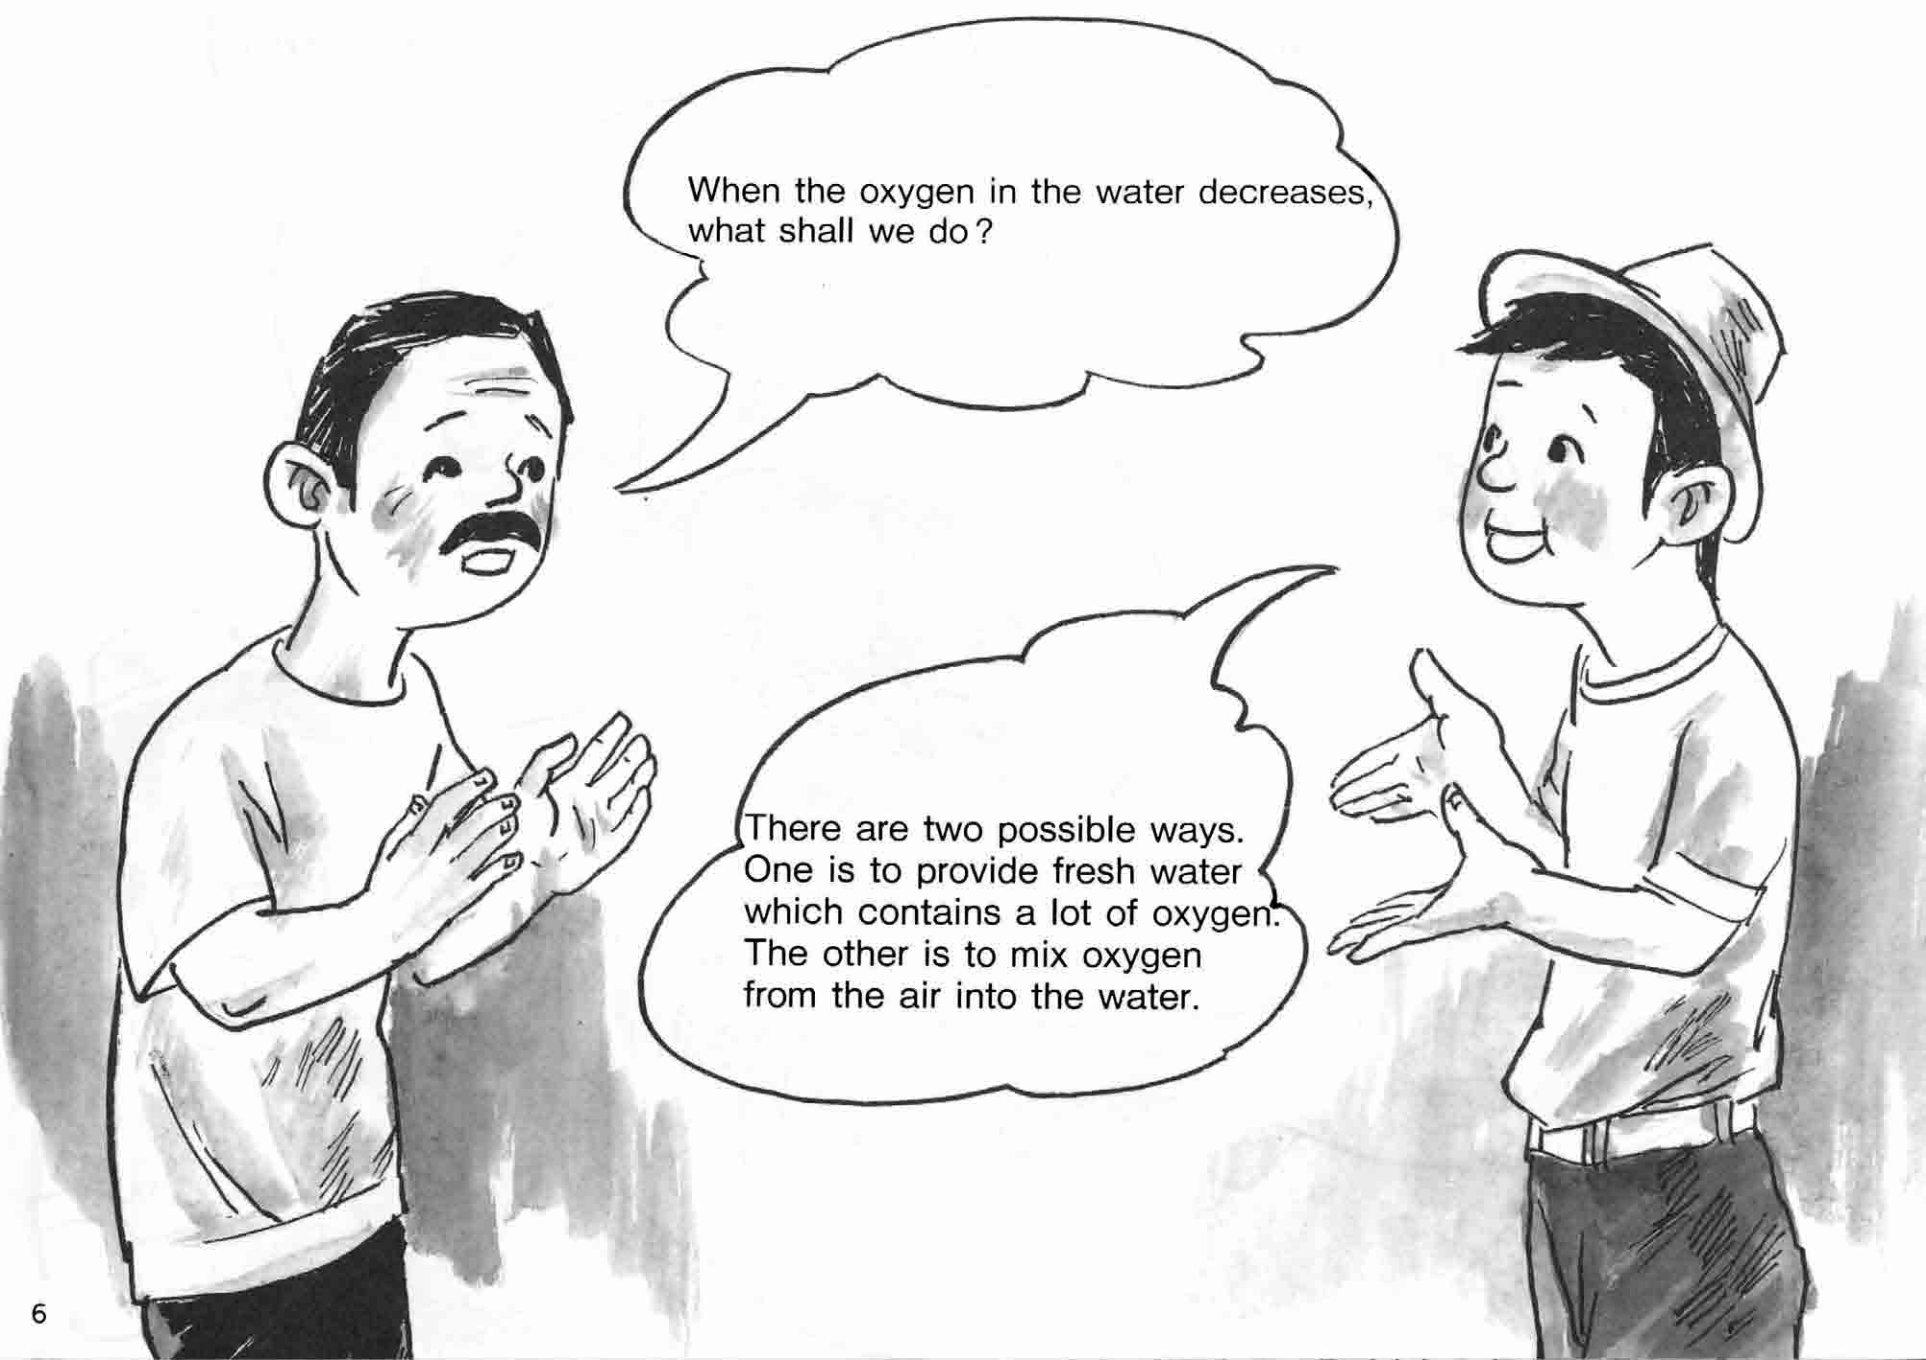

All creatures need oxygen in the air to live.

Fish absorb oxygen in the water through the gills.

When the oxygen in the water decreases,
what shall we do?

There are two possible ways.
One is to provide fresh water
which contains a lot of oxygen.
The other is to mix oxygen
from the air into the water.
