

He introduces three concrete methods to save the fish.

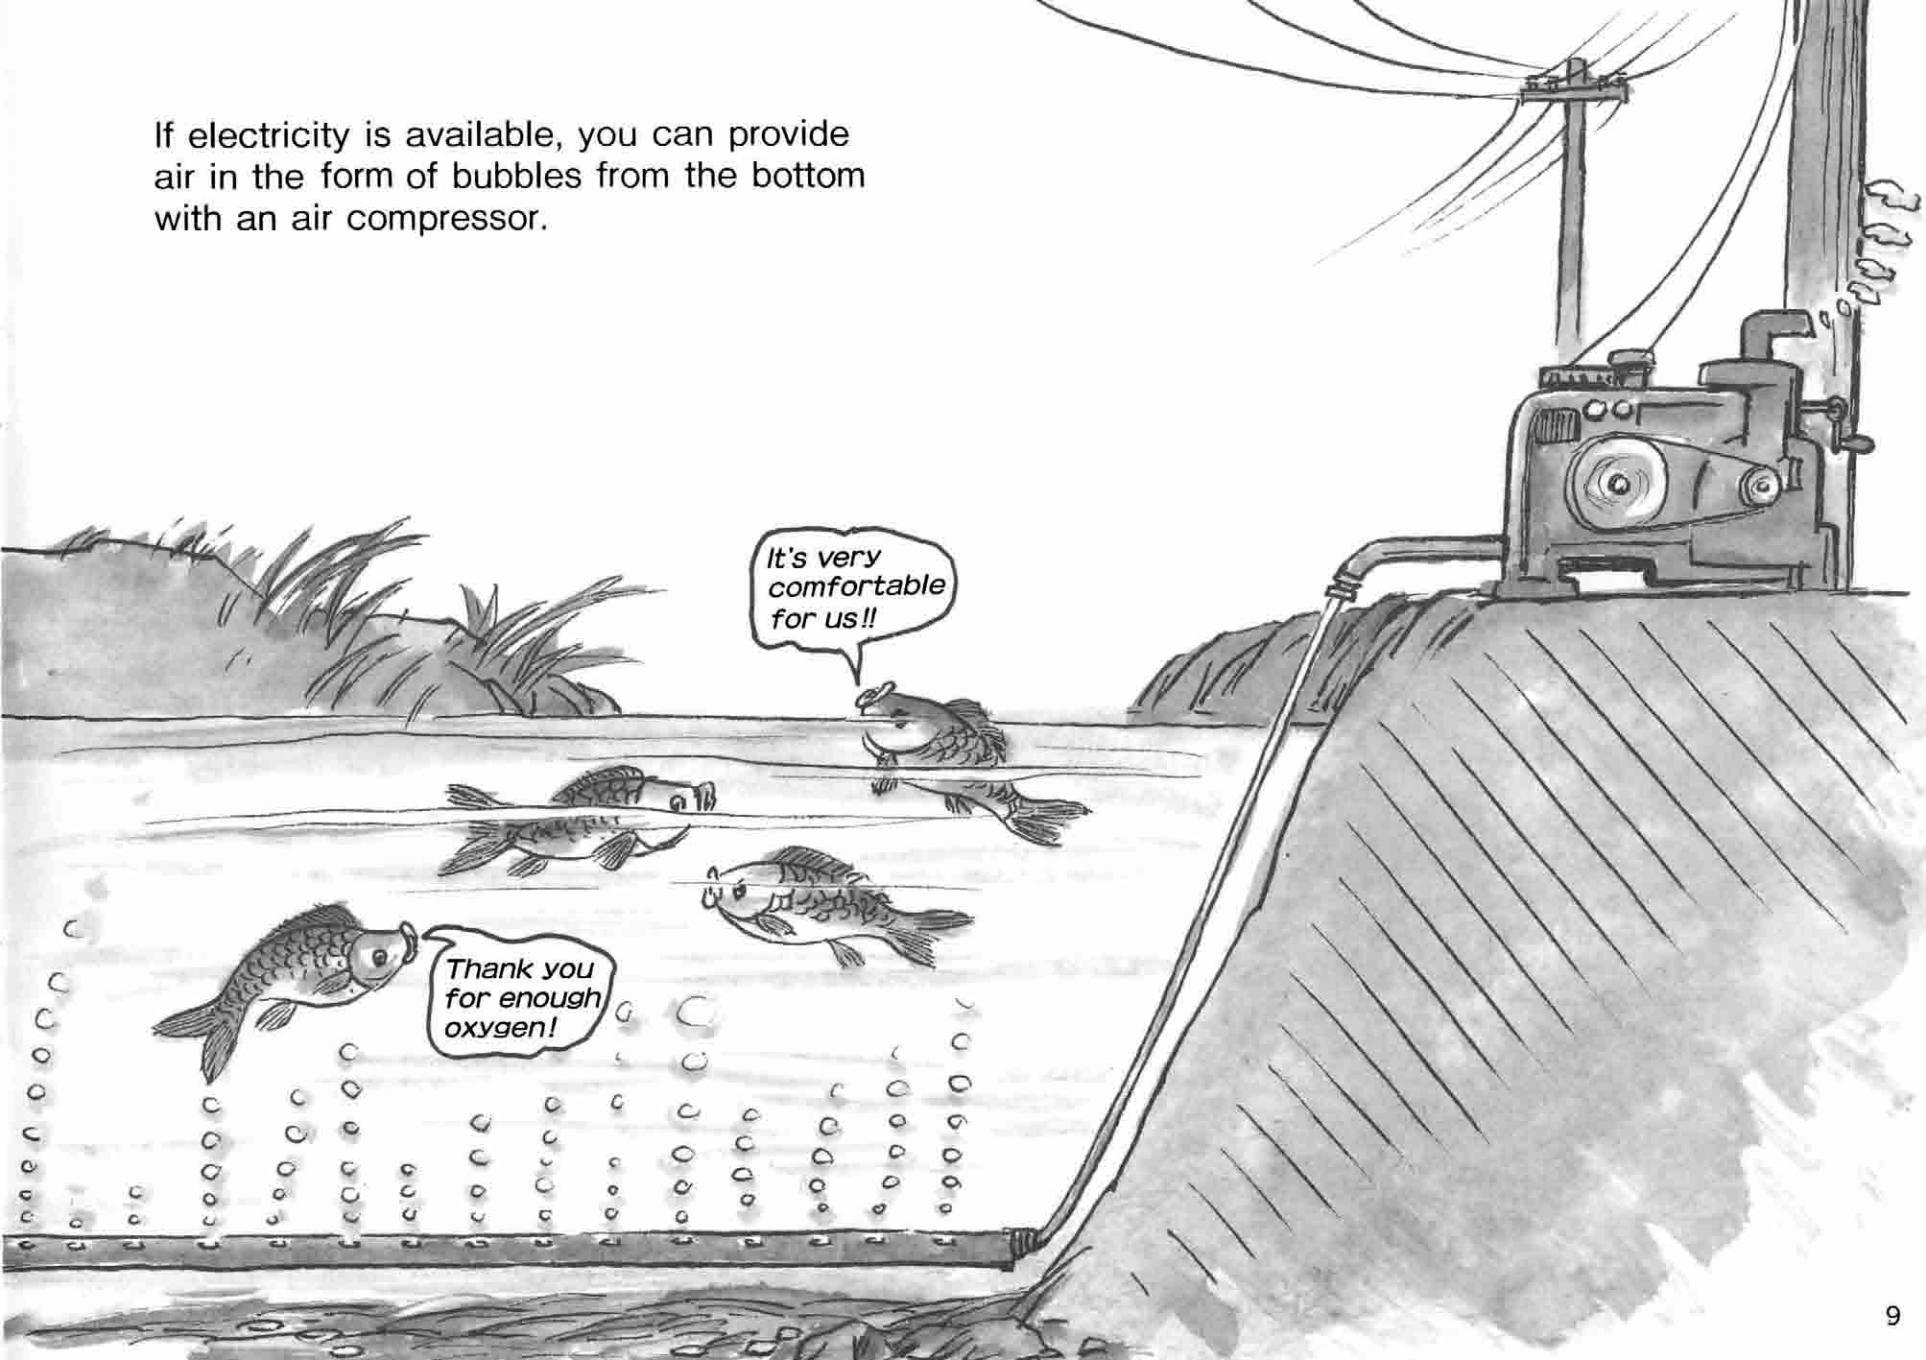

One method is to draw fresh water, which contains a lot of oxygen, from a river or well and pour it into the fish pond, while draining the old water.

Another method is to mix in the oxygen by agitating the water with a wheel.

If electricity is available, you can provide air in the form of bubbles from the bottom with an air compressor.

It's very comfortable for us!!

Thank you for enough oxygen!
